Jordan Patel
Backend Software Engineer | jordan.patel@example.test

SUMMARY
Backend engineer with 4 years of experience building Python services and event-driven data systems. Focused on reliability, measurable performance, and clear operational ownership.

EXPERIENCE
Backend Engineer - Meridian Analytics | 2022-Present
- Designed and owned a Kafka-based real-time event pipeline processing about 10,000 events per second. Added idempotent consumers and bounded retries for duplicate and delayed events; measured p95 processing latency below 200 ms during normal load.
- Reworked PostgreSQL indexes and query plans for a reporting API, reducing p95 query latency by 42% while preserving correctness for concurrent updates.
- Added Docker-based local environments and CI checks for a Python/FastAPI service; improved deployment rollback and on-call runbooks.
- Partnered with product and data teams to investigate production incidents using structured logs, metrics, and trace IDs.

Software Engineer - Cedar Labs | 2020-2022
- Built Python REST endpoints backed by PostgreSQL and Redis for internal operations tools.
- Added integration tests and reviewed schema changes with application and analytics teams.

TECHNOLOGIES
Python, FastAPI, Kafka, PostgreSQL, Redis, Docker, GitHub Actions, Linux, Prometheus, Grafana

EDUCATION
B.S. Computer Science - State University, 2020
